List of Figures	vii
List of Tables	ix
Preface to the second edition	xi
Preface to the first edition	xiii
Commonly Used Notations	xv
Chapter 1. An Introduction to the Homotopy Groups of Spheres	1
1. Classical Theorems Old and New	2
Homotopy groups. The Hurewicz and Freudenthal theorems. Stable stems. The Hopf map. Serre’s finiteness theorem. Nishida’s nilpotence theorem. Cohen, Moore and Neisendorfer’s exponent theorem. Bott periodicity. The $J$ -homomorphism.	
2. Methods of Computing $\pi_*(S^n)$	5
Eilenberg–Mac Lane spaces and Serre’s method. The Adams spectral sequence. Hopf invariant one theorems. The Adams–Novikov spectral sequence. Tables in low dimensions for $p = 3$ .	
3. The Adams–Novikov $E_2$ -term, Formal Group Laws, and the Greek Letter Construction	12
Formal group laws and Qillen’s theorem. The Adams–Novikov $E_2$ -term as group cohomology. Alphas, beta and gamma. The Morava–Landweber theorem and higher Greek letters. Generalized Greek letter elements.	
4. More Formal Group Law Theory, Morava’s Point of View, and the Chromatic Spectral Sequence	19
The Brown–Peterson spectrum. Classification of formal group laws. Morava’s group action, its orbits and stabilizers. The chromatic resolution and the chromatic spectral sequence. Bockstein spectral sequences. Use of cyclic subgroups to detect Arf invariant elements. Morava’s vanishing theorem. Greek letter elements in the chromatic spectral sequence.	
5. Unstable Homotopy Groups and the EHP Spectral Sequence	24
The EHP sequences. The EHP spectral sequence. The stable zone. The inductive method. The stable EHP spectral sequence. The Adams vector field theorem. James periodicity. The $J$ -spectrum. The spectral sequence for $J_*(RP^\infty)$ and $J_*(B\Sigma_p)$ . Relation to the Segal conjecture. The Mahowald root invariant.	
Chapter 2. Setting up the Adams Spectral Sequence	41

1. The Classical Adams Spectral Sequence	41
Mod ( $p$ ) Eilenberg–Mac Lane spectra. Mod ( $p$ ) Adams resolutions. Differentials. Homotopy inverse limits. Convergence. The extension problem. Examples: integral and mod ( $p^i$ ) Eilenberg–Mac Lane spectra.	
2. The Adams Spectral Sequence Based on a Generalized Homology Theory	49
$E_*$ -Adams resolutions. $E$ -completions. The $E_*$ -Adams spectral sequence. Assumptions on the spectrum $E$ . $E_*(E)$ is a Hopf algebroid. The canonical Adams resolution. Convergence. The Adams filtration.	
3. The Smash Product Pairing and the Generalized Connecting Homomorphism	53
The smash product induces a pairing in the Adams spectral sequence. A map that is trivial in homology raises Adams filtration. The connecting homomorphism in Ext and the geometric boundary map.	
Chapter 3. The Classical Adams Spectral Sequence	59
1. The Steenrod Algebra and Some Easy Calculations	59
Milnor’s structure theorem for $A_*$ . The cobar complex. Multiplication by $p$ in the $E_\infty$ -term. The Adams spectral sequence for $\pi_*(MU)$ . Computations for $MO$ , $bu$ and $bo$ .	
2. The May Spectral Sequence	67
May’s filtration of $A_*$ . Nonassociativity of May’s $E_1$ -term and a way to avoid it. Computations at $p = 2$ in low dimensions. Computations with the subalgebra $A(2)$ at $p = 2$ .	
3. The Lambda Algebra	76
$\Lambda$ as an Adams $E_1$ -term. The algebraic EHP spectral sequence. Serial numbers. The Curtis algorithm. Computations below dimension 14. James periodicity. The Adams vanishing line. $d_1$ is multiplication by $\lambda_{-1}$ . Illustration for $S^3$ .	
4. Some General Properties of Ext	84
Ext <sup><math>s</math></sup> for $s \leq 3$ . Behavior of elements in Ext <sup>2</sup> . Adams’ vanishing line of slope 1/2 for $p = 2$ . Periodicity above a line of slope 1/5 for $p = 2$ . Elements not annihilated by any periodicity operators and their relation to im $J$ . An elementary proof that most of these elements are nontrivial.	
5. Survey and Further Reading	92
Exotic cobordism theories. Decreasing filtrations of $A_*$ and the resulting spectral sequences. Application to $MSp$ . Mahowald’s generalizations of $\Lambda$ . $v_n$ -periodicity in the Adams spectral sequence. Selected references to related work.	
Chapter 4. $BP$ -Theory and the Adams–Novikov Spectral Sequence	99
1. Quillen’s Theorem and the Structure of $BP_*(BP)$	99
Complex cobordism. Complex orientation of a ring spectrum. The formal group law for a complex oriented homology theory. Quillen’s theorem equating the Lazard and complex cobordism rings. Landweber and Novikov’s theorem on the structure of $MU_*(MU)$ . The Brown–Peterson spectrum $BP$ . Quillen’s idempotent operation and $p$ -typical formal group laws. The structure of $BP_*(BP)$ .	
2. A Survey of $BP$ -Theory	107
Bordism groups of spaces. The Sullivan–Baas construction. The Johnson–Wilson spectrum $BP\langle n \rangle$ . The Morava $K$ -theories $K(n)$ . The Landweber filtration	

and exact functor theorems. The Conner–Floyd isomorphism.  $K$ -theory as a functor of complex cobordism. Johnson and Yosimura’s work on invariant regular ideals. Infinite loop spaces associated with  $MU$  and  $BP$ ; the Ravenel–Wilson Hopf ring. The unstable Adams–Novikov spectral sequence of Bendersky, Curtis and Miller.

3. Some Calculations in  $BP_*(BP)$  113

The Morava–Landweber invariant prime ideal theorem. Some invariant regular ideals. A generalization of Witt’s lemma. A formula for the universal  $p$ -typical formal group law. Formulas for the coproduct and conjugation in  $BP_*(BP)$ . A filtration of  $BP_*(BP)/I_n$ .

4. Beginning Calculations with the Adams–Novikov Spectral Sequence 126

and Miller. Low dimensional Ext of the algebra of Steenrod reduced powers. Bockstein spectral sequences leading to the Adams–Novikov  $E_2$ -term. Calculations at odd primes. Toda’s theorem on the first nontrivial odd primary Novikov differential. Chart for  $p = 5$ . Calculations and charts for  $p = 2$ . Comparison with the Adams spectral sequence.

Chapter 5. The Chromatic Spectral Sequence 143

1. The Algebraic Construction 144

Greek letter elements and generalizations. The chromatic resolution, spectral sequence, and cobar complex. The Morava stabilizer algebra  $\Sigma(n)$ . The change-of-rings theorem. The Morava vanishing theorem. Signs of Greek letter elements. Computations with  $\beta_t$ . Decompsibility of  $\gamma_1$ . Chromatic differentials at  $p = 2$ . Divisibility of  $\alpha_1\beta_p$ .

2.  $\text{Ext}^1(BP_*/I_n)$  and Hopf Invariant One 154

$\text{Ext}^0(BP_*)$ .  $\text{Ext}^0(M_1^0)$ .  $\text{Ext}^1(BP_*)$ . Hopf invariant one elements. The Miller–Wilson calculation of  $\text{Ext}^1(BP_*/I_n)$ .

3.  $\text{Ext}(M^1)$  and the  $J$ -Homomorphism 161

$\text{Ext}(M^1)$ . Relation to  $\text{im } J$ . Patterns of differentials at  $p = 2$ . Computations with the mod (2) Moore spectrum.

4.  $\text{Ext}^2$  and the Thom Reduction 168

Results of Miller, Ravenel and Wilson ( $p > 2$ ) and Shimomura ( $p = 2$ ) on  $\text{Ext}^2(BP_*)$ . Behavior of the Thom reduction map. Arf invariant differentials at  $p > 2$ . Mahowald’s counterexample to the doomsday conjecture.

5. Periodic Families in  $\text{Ext}^2$  174

Smith’s construction of  $\beta_t$ . Obstructions at  $p = 3$ . Results of Davis, Mahowald, Oka, Smith and Zahler on permanent cycles in  $\text{Ext}^2$ . Decomposables in  $\text{Ext}^2$ .

6. Elements in  $\text{Ext}^3$  and Beyond 179

Products of alphas and betas in  $\text{Ext}^3$ . Products of betas in  $\text{Ext}^4$ . A possible obstruction to the existence of  $V(4)$ .

Chapter 6. Morava Stabilizer Algebras 187

1. The Change-of-Rings Isomorphism 187

Theorems of Ravenel and Miller. Theorems of Morava. General nonsense about Hopf algebroids. Formal group laws of Artin local rings. Morava’s proof. Miller and Ravenel’s proof.

2. The Structure of $\Sigma(n)$	192
Relation to the group ring for $S_n$ . Recovering the grading via an eigenspace decomposition. A matrix representation of $S_n$ . A splitting of $S_n$ when $p \nmid n$ . Poincaré duality and periodic cohomology of $S_n$ .	
3. The Cohomology of $\Sigma(n)$	198
A May filtration of $\Sigma(n)$ and the May spectral sequence. The open subgroup theorem. Cohomology of some associated Lie algebras. $H^1$ and $H^2$ . $H^*(S(n))$ for $n = 1, 2, 3$ .	
4. The Odd Primary Kervaire Invariant Elements	213
The nonexistence of certain elements and spectra. Detecting elements with the cohomology of $\mathbf{Z}/(p)$ . Differentials in the Adams spectral sequence.	
5. The Spectra $T(m)$	220
A splitting theorem for certain Thom spectra. Application of the open subgroup theorem. $\text{Ext}^0$ and $\text{Ext}^1$ .	
Chapter 7. Computing Stable Homotopy Groups with the Adams–Novikov Spectral Sequence	225
1. The method of infinite descent	227
$\Gamma(m+1)$ , $A(m)$ , and $G(m+1, k-1)$ . Weak injective comodules. Quillen operations. $i$ -free comodules. The small descent spectral sequence and topological small descent spectral sequence. Input/output procedure. The 4-term exact sequence. Hat notation. A generalization of the Morava–Landweber theorem. The $\widehat{\lambda}_i$ and $D_{m+1}^0$ . Poincaré series. $\text{Ext}_{\Gamma(m+1)}^1$ . Properties of weak injectives.	
2. The comodule $E_{m+1}^2$	238
$D_1^1$ . The Poincaré series for $E_{m+1}^2$ . $\text{Ext}(E_{m+1}^2)$ below dimension $p^2 \widehat{v}_1 $ . The comodules $B$ and $U$ .	
3. The homotopy of $T(0)_{(2)}$ and $T(0)_{(1)}$	249
The $j$ -freeness of $B$ . The elements $u_{i,j}$ . A short exact sequence for $U$ . $\pi_*(T(0)_{(2)})$ . Cartan–Eilenberg differentials for $T(0)_{(1)}$ .	
4. The proof of Theorem 7.3.15	260
$P(1)_*$ . $\widetilde{E}_1^2$ , $\widetilde{D}_1^2$ , and $\widetilde{E}_1^3$ . $P$ -free comodules. A filtration of $\widetilde{D}_1^2$ . A 4-term exact sequence of $P(1)_*$ -comodules. $C_i$ and the skeletal filtration spectral sequence.	
5. Computing $\pi_*(S^0)$ for $p = 3$	276
The input list <b>I</b> . Computation of differentials in the topological small descent spectral sequence.	
6. Computations for $p = 5$	281
The differential on $\gamma_3$ and the nonexistence of $V(3)$ for $p = 5$ . The input list <b>I</b> . Differentials.	
Appendix A1. Hopf Algebras and Hopf Algebroids	299
1. Basic Definitions	301
Hopf algebroids as cogroup objects in the category of commutative algebras. Comodules. Cotensor products. Maps of Hopf algebroids. The associated Hopf algebra. Normal maps. Unicursal Hopf algebroids. The kernel of a normal map. Hopf algebroid extensions. The comodule algebra structure theorem. Invariant ideals. Split Hopf algebroids.	

2. Homological Algebra	309
Injective comodules. The derived functors $\text{Cotor}$ and $\text{Ext}$ . Relative injectives and resolutions. The cobar resolution and complex. Cup products. Ext isomorphisms for invariant ideals and split Hopf algebroids.	
3. Some Spectral Sequences	315
The resolution spectral sequence. Filtered Hopf algebroids. Filtrations by powers of the unit coideal. The spectral sequence associated with a Hopf algebroid map. Change-of-rings isomorphism. The Cartan–Eilenberg spectral sequence. A formulation due to Adams. The $E_2$ -term for a cocentral extension of Hopf algebras.	
4. Massey Products	323
Definitions of $n$ -fold Massey products and indeterminacy. Defining systems. Juggling theorems: associativity and commutativity formulas. Convergence of Massey products in spectral sequences. A Leibnitz formula for differentials. Differentials and extensions in spectral sequences.	
5. Algebraic Steenrod Operations	332
Construction, Cartan formula and Adem relations. Commutativity with suspension. Kudo transgression theorem.	
Appendix A2. Formal Group Laws	339
1. Universal Formal Group Laws and Strict Isomorphisms	339
Definition and examples of formal group laws. Homomorphisms, isomorphisms and logarithms. The universal formal group law and the Lazard ring. Lazard’s comparison lemma. The Hopf algebroid $VT$ . Proof of the comparison lemma.	
2. Classification and Endomorphism Rings	351
Hazewinkel’s and Araki’s generators. The right unit formula. The height of a formal group law. Classification in characteristic $p$ . Finite fields, Witt rings and division algebras. The endomorphism ring of a height $n$ formal group law.	
Appendix A3. Tables of Homotopy Groups of Spheres	361

## List of Figures

1.2.16 The Adams spectral sequence for $p = 3$ , $t - s \leq 45$ .	11
1.2.18 The Adams–Novikov spectral sequence for $p = 3$ , $t - s \leq 45$	13
1.5.9 The EPSS for $p = 2$ and $k \leq 7$ .	27
1.5.24 A portion of the $E_2$ -term of the spectral sequence of Theorem 1.5.23 converging to $J_*(\mathbf{R}P^\infty)$ and showing the $d_2$ 's and $d_3$ 's listed in Theorem 1.5.23, part (c).	36
3.2.9 The May $E_2$ -term for $p = 2$ and $t - s \leq 13$	71
3.2.17 The May spectral sequence for $\text{Ext}_{A(2)_*}(\mathbf{Z}/(2), A(0)_*)$ . (a) The spectral sequence for $\overline{E}_3$ ; (b) the $\overline{E}_3$ -term; (c) differentials in $E_3$ ; (d) $E_\infty$	75
3.3.10 The EHP spectral sequence (3.3.7) for $t - s \leq 14$	79
3.3.18 The unstable Adams $E_2$ -term for $S^3$ .	83
3.4.20 $\text{Ext}^{s-1,t} H_*(\overline{W})$ .	91
4.4.16 $\text{Ext}_{BP_*(BP)}^{s,t}(BP_*, BP_*/I_1)$ for $p = 5$ and $t - s \leq 240$ .	132
4.4.21 The Adams–Novikov spectral sequence for $p = 5$ , $t - s \leq 240$ , and $s \geq 2$ .	134
4.4.23 (a) $\text{Ext}(BP_*/I_4)$ for $p = 2$ and $t - s < 29$ . (b) $\text{Ext}(BP_*/I_3)$ for $t - s \leq 28$ . (c) $\text{Ext}(BP_*/I_2)$ for $t - s \leq 27$ .	136
4.4.32 $\text{Ext}(BP_*/I_1)$ for $p = 2$ and $t - s \leq 26$	137
4.4.45 $\text{Ext}(BP_*)$ for $p = 2$ , $t - s \leq 25$ .	140
4.4.46 $\text{Ext}_{A_*}(\mathbf{Z}/2, \mathbf{Z}/2)$ for $t - s \leq 25$ .	140
7.3.17 $\text{Ext}_{\Gamma(1)}(T_0^{(1)})$	261
A3.16 The Adams spectral sequence for $p = 2$ , $t - s \leq 29$ .	362
A3.18 The Adams spectral sequence for $p = 2$ , $28 \leq t - s \leq 45$	374
A3.19 The Adams spectral sequence for $p = 2$ , $44 \leq t - s \leq 61$ . (Differentials tentative)	374
A3.21 The Adams–Novikov spectral sequence for $p = 2$ , $t - s \leq 39$ . ( $v_1$ -periodic elements omitted. Computations for $t - s \leq 30$ are tentative.)	375

## List of Tables

4.4.4	Correspondence between Adams–Novikov spectral sequence and Adams spectral sequence permanent cycles for $p = 2$ , $14 \leq t - s \leq 24$	141
A3.3	$\pi_*^S$ at $p = 2^a$	363
A3.4	Primary Stable Homotopy Excluding $\text{im } J^a$	366
A3.5	Primary Stable Homotopy Excluding $\text{im } J$	367
A3.6	Toda’s calculation of unstable homotopy groups $\pi_{n+k}(S^n)$ for $n \leq k + 2$ and $k \leq 19$ .	373

## Preface to the second edition

The subject of  $BP$ -theory has grown dramatically since the appearance of the first edition 17 years ago. One major development was the proof by Devinatz, Hopkins and Smith (see Devinatz, Hopkins and Smith [?] and Hopkins and Smith [?]) of nearly all the conjectures made in Ravenel [?]. An account of this work can be found in our book Ravenel [?]. The only conjecture of Ravenel [?] that remains is Telescope Conjecture. An account of our unsuccessful attempt to disprove it is given in Mahowald, Ravenel, and Shick [?].

Another big development is the emergence of elliptic cohomology and the theory of topological modular forms. There is still no comprehensive introduction to this topic. Some good papers to start with are Ando, Hopkins and Strickland [?], Hopkins and Mahowald [?], Landweber, Ravenel and Stong [?], and Rezk [?], which is an account of the still unpublished Hopkins-Miller theorem.

The seventh and final chapter of the book has been completely rewritten and is nearly twice as long as the original. We did this with an eye to carrying out future research in this area.

I am grateful to the many would be readers who urged me to republish this book and to the AMS for its assistance in getting the original manuscript retypeset. Peter Landweber was kind enough to provide me with a copious list of misprints he found in the first edition. Nori Minami and Igor Kriz helped in correcting some errors in § 4.3. Mike Hill and his fellow MIT students provided me with a timely list of typos in the online version of this edition. Hirofumi Nakai was very helpful in motivating me to make the revisions of Chapter 7.

## Preface to the first edition

My initial inclination was to call this book *The Music of the Spheres*, but I was dissuaded from doing so by my diligent publisher, who is ever mindful of the sensibilities of librarians. The purpose of this book is threefold: (i) to make  $BP$ -theory and the Adams–Novikov spectral sequence more accessible to nonexperts, (ii) to provide a convenient reference for workers in the field, and (iii) to demonstrate the computational potential of the indicated machinery for determining stable homotopy groups of spheres. The reader is presumed to have a working knowledge of algebraic topology and to be familiar with the basic concepts of homotopy theory. With this assumption the book is almost entirely self-contained, the major exceptions (e.g., Sections 5.4, 5.4, A1.4, and A1.5) being cases in which the proofs are long, technical, and adequately presented elsewhere.

The subject matter is a difficult one and this book will not change that fact. We hope that it will make it possible to learn the subject other than by the only practical method heretofore available, i.e., by numerous exhausting conversations with one of a handful of experts. Much of the material here has been previously published in journal articles too numerous to keep track of. However, a lot of the foundations of the subject, e.g., Chapter 2 and Appendix 1, have not been previously worked out in sufficient generality and the author found it surprisingly difficult to do so.

The reader (especially if she is a graduate student) should be warned that many portions of this volume contain more than he is likely to want or need to know. In view of (ii), results are given (e.g., in Sections 4.3, 6.3, and A1.4) in greater strength than needed at present. We hope the newcomer to the field will not be discouraged by abundance of material.

The homotopy groups of spheres is a highly computational topic. The serious reader is strongly encouraged to reproduce and extend as many of the computations presented here as possible. There is no substitute for the insight gained by carrying out such calculations oneself.

Despite the large amount of information and techniques currently available, stable homotopy is still very mysterious. Each new computational breakthrough heightens our appreciation of the difficulty of the problem. The subject has a highly experimental character. One computes as many homotopy groups as possible with existing machinery, and the resulting data form the basis for new conjectures and new theorems, which may lead to better methods of computation. In contrast with physics, in this case the experimentalists who gather data and the theoreticians who interpret them are the same individuals.

The core of this volume is Chapters 2–6 while Chapter 1 is a casual nontechnical introduction to this material. Chapter 7 is a more technical description of actual computations of the Adams–Novikov spectral sequence for the stable homotopy

groups of spheres through a large range of dimensions. Although it is likely to be read closely by only a few specialists, it is in some sense the justification for the rest of the book, the computational payoff. The results obtained there, along with some similar calculations of Tangora, are tabulated in Appendix 3.

Appendices 1 and 2 are utilitarian in nature and describe technical tools used throughout the book. Appendix 1 develops the theory of Hopf algebroids (of which Hopf algebras are a special case) and useful homological tools such as relative injective resolutions, spectral sequences, Massey products, and algebraic Steenrod operations. It is not entertaining reading; we urge the reader to refer to it only when necessary.

Appendix 2 is a more enjoyable self-contained account of all that is needed from the theory of formal group laws. This material supports a bridge between stable homotopy theory and algebraic number theory. Certain results (e.g., the cohomology of some groups arising in number theory) are carried across this bridge in Chapter 6. The house they inhabit in homotopy theory, the chromatic spectral sequence, is built in Chapter 5.

The logical interdependence of the seven chapters and three appendixes is displayed in the accompanying diagram.

It is a pleasure to acknowledge help received from many sources in preparing this book. The author received invaluable editorial advice from Frank Adams, Peter May, David Pengelley, and Haynes Miller. Steven Mitchell, Austin Pearlman, and Bruce McQuistan made helpful comments on various stages of the manuscript, which owes its very existence to the patient work of innumerable typists at the University of Washington.

Finally, we acknowledge financial help from six sources: the National Science Foundation, the Alfred P. Sloan Foundation, the University of Washington, the Science Research Council of the United Kingdom, the Sonderforschungsbereich of Bonn, West Germany, and the Troisième Cycle of Bern, Switzerland.

## Commonly Used Notations

$\mathbf{Z}$	Integers
$\mathbf{Z}_p$	$p$ -adic integers
$\mathbf{Z}_{(p)}$	Integers localized at $p$
$\mathbf{Z}/(p)$	Integers mod $p$
$\mathbf{Q}$	Rationals
$\mathbf{Q}_p$	$p$ -adic numbers
$P(x)$	Polynomial algebra on generators $x$
$E(x)$	Exterior algebra on generators $x$
$\square$	Cotensor product (Section A1.1)

Given suitable objects  $A$ ,  $B$ , and  $C$  and a map  $f: A \rightarrow B$ , the evident map  $A \otimes C \rightarrow B \otimes C$  is denoted by  $f \otimes C$ .
