The slice spectral sequence for $MU_{\mathbb{R}}$

The proof of the Gap Theorem

Representation spheres

Let V be a finite dimensional orthogonal representation of G . The key example for us is the regular representation ρ_G , the vector space $\mathbf{R}[G]$ where G acts by left multiplication.

S^V denotes both the one point compactification of V , with basepoint at ∞ , and the corresponding suspension spectrum.

Constructing our spectrum Ω

For $G = C_8$, we can form the norm $N_{C_2}^G MU_{\mathbb{R}}$, which we abbreviate by $MU^{((G))}$. It is underlain by the 4-fold smash power $MU^{(4)}$ with the group G permuting the C_2 -invariant factors.

It can be made into a periodic spectrum by inverting a certain element $D \in \pi_{19\rho_8}^G MU^{((G))}$. $D^{-1} MU^{((G))}$ is the telescope for the diagram

$$MU^{((G))} \xrightarrow{D} \Sigma^{-19\rho_8} MU^{((G))} \xrightarrow{D} \Sigma^{-38\rho_8} MU^{((G))} \xrightarrow{D} \dots$$

The slice spectral sequence for MUR

We have a complete description of the slice spectral sequence for MUR , including all of its infinitely many differentials.

These differentials are needed in the proof of the Periodicity Theorem.

As in the past, we need some extra geometry to understand them. In this case it is all encoded in the well understood relation between MU and MO , between complex and unoriented cobordism.

The bottom G -cell of $G_+ \wedge_H S^{m\rho_H}$ is

$$(G_+ \wedge_H S^{m\rho_H})^H = G_+ \wedge_H S^m$$

in dimension m , while the top cell is in dimension $m|H|$. Similar statements hold for $C^{m,H}$, $C^{-m,H}$ and their fixed point subcomplexes.

It follows that for $m \geq 0$, $\pi_i K_{m,H}^G$ is trivial unless $m \leq i \leq m|H|$, and $\pi_i K_{-m,H}^G$ is trivial unless $-m \geq i \geq -m|H|$.

For the Gap Theorem we want to show that $\pi_{-2} K_{m,H}^G = 0$ in all cases.

The proof of the Gap Theorem (continued)

The bottom G -cell of $G_+ \wedge_H S^{m\rho_H}$ is

$$(G_+ \wedge_H S^{m\rho_H})^H = G_+ \wedge_H S^m$$

in dimension m , while the top cell is in dimension $m|H|$. Similar statements hold for $C^{m,H}$, $C^{-m,H}$ and their fixed point subcomplexes.

It follows that for $m \geq 0$, $\pi_i K_{m,H}^G$ is trivial unless $m \leq i \leq m|H|$, and $\pi_i K_{-m,H}^G$ is trivial unless $-m \geq i \geq -m|H|$.

For the Gap Theorem we want to show that $\pi_{-2} K_{m,H}^G = 0$ in all cases. From the above we see that **the only values of m we need to consider are $m = -1$ and $m = -2$.**
