### Theorem (R, 1982)

*For each  $n$  and  $p$ , and for each finite group  $G$ ,  $K(n)^* BG$  has a finite rank as a  $K(n)^*$ -module.*

What is the rank of  $K(n)^* BG$ ?

Some clues:

- For a finite abelian  $p$ -group  $A$ , the rank of  $K(n)^{even} BA$  is  $|A|^n$ , and  $K(n)^{odd} BA = 0$ .

## Second precedent: A finiteness theorem

### Theorem (R, 1982)

For each  $n$  and  $p$ , and for each finite group  $G$ ,  $K(n)^*BG$  has a finite rank as a  $K(n)^*$ -module.

### What is the rank of $K(n)^*BG$ ?

Some clues:

- For a finite abelian  $p$ -group  $A$ , the rank of  $K(n)^{even}BA$  is  $|A|^n$ , and  $K(n)^{odd}BA = 0$ .
- Atiyah's theorem implies that the rank of  $K(1)^*BG$  is the number of conjugacy classes of elements of order  $p^i$  (for some  $i$ ) in  $G$ .

is the number of  $G$  orbits in  $G_{n,p}$ .

We will study this for the symmetric group  $G = S_3$ .

For  $p = 2$ , we have three noncommuting elements of order 2, each generating a subgroup  $H_i$  of order 2 for  $1 \leq i \leq 3$ . They do not commute with each other and they are permuted by the action of  $G$ . The set  $G_{n,2}$  is the (non-disjoint) union of the three sets  $H_i^n$ ,

## Theorem B (Part 1)

Let  $G$  be a finite group. The Morava  $K$ -theory Euler characteristic

$$\chi_{n,p}^G := \dim K(n)^{\text{even}} BG - \dim K(n)^{\text{odd}} BG$$

is the number of  $G$  orbits in  $G_{n,p}$ .

We will study this for the symmetric group  $G = S_3$ .

For  $p = 2$ , we have three noncommuting elements of order 2, each generating a subgroup  $H_i$  of order 2 for  $1 \leq i \leq 3$ . They do not commute with each other and they are permuted by the action of  $G$ . The set  $G_{n,2}$  is the (non-disjoint) union of the three sets  $H_i^n$ , any two of which intersect in the single  $n$ -tuple  $(e, e, \dots, e)$ .

$$\chi_{n,p}^G = \sum_{A \leq G} \frac{|A|}{|G|} |A_{(p)}|^n \mu(A).$$

We illustrate the case  $G = A_4$ . It has four maximal abelian subgroups of order 3 and one isomorphic to  $C_2 \times C_2$ . The latter has three subgroups of order 2 on which  $\mu$  vanishes, since each is contained in a single maximal abelian subgroup. The trivial subgroup, being contained in five maximal abelian subgroups, has  $\mu = -4$ . Thus we have

$$\begin{aligned}\chi_{n,2}^G &= \frac{4}{12} \cdot 4^n + 4 \cdot \frac{3}{12} - \frac{4}{12} = \frac{4^n + 2}{3} \\ \chi_{n,3}^G &= \frac{4}{12} + 4 \cdot \frac{3}{12} \cdot 3^n - \frac{4}{12} = 3^n.\end{aligned}$$

## The Lubin-Tate construction (continued)

When  $F$  is the multiplicative formal group law, we get the usual multiplicative groups structure on  $1 + \overline{\mathfrak{m}}$ . The elements of finite order are roots of unity congruent to 1 modulo  $\overline{\mathfrak{m}}$ , i.e., the  $(p^i)$ th roots of unity for various  $i$ . The field obtained by adjoining all of these elements to  $\mathbf{Q}_p$  is the maximal totally ramified abelian extension.

The main result of Lubin-Tate is that we can construct the maximal abelian totally ramified extension of  $K$  in a similar way with the right formal group law  $F$ .

## The generalized character theorem (continued)

$$\begin{array}{ccccc}
 x & E_n^* B\mathbf{Z}/(p^i) & \xrightarrow{\varphi_i} & A[[x]]/(f^{(i)}(x)) & \longrightarrow & L_i \\
 \downarrow & \downarrow & & \downarrow f & & \downarrow \\
 [p](x) & E_n^* B\mathbf{Z}/(p^{i+1}) & \xrightarrow{\varphi_{i+1}} & A[[x]]/(f^{(i+1)}(x)) & \longrightarrow & L_{i+1}
 \end{array}$$

Passing to the colimit as  $i \rightarrow \infty$ , we get a ring homomorphism

$$\varphi : \varinjlim_i E_n^* B\mathbf{Z}/(p^i) \rightarrow L.$$

An element  $\gamma \in G_{n,p}$  is a homomorphism  $\mathbf{Z}_p^n \rightarrow G$ . Since  $G$  is finite it must factor through some  $\mathbf{Z}/(p^i)^n$ , so we get a map

$$\gamma^* : E_n^* BG \rightarrow \varinjlim_i E_n^* B\mathbf{Z}/(p^i)^n$$

that is invariant under conjugation.

Next note that since  $A = W(\mathbf{F}_{p^n})$  is a free  $\mathbf{Z}_p$ -module of rank  $n$ ,

## The generalized character theorem (continued)

$$\begin{array}{ccccc}
 x & E_n^* B\mathbf{Z}/(p^i) & \xrightarrow{\varphi_i} & A[[x]]/(f^{(i)}(x)) & \longrightarrow & L_i \\
 \downarrow & \downarrow & & \downarrow f & & \downarrow \\
 [p](x) & E_n^* B\mathbf{Z}/(p^{i+1}) & \xrightarrow{\varphi_{i+1}} & A[[x]]/(f^{(i+1)}(x)) & \longrightarrow & L_{i+1}
 \end{array}$$

Passing to the colimit as  $i \rightarrow \infty$ , we get a ring homomorphism

$$\varphi : \varinjlim_i E_n^* B\mathbf{Z}/(p^i) \rightarrow L.$$

An element  $\gamma \in G_{n,p}$  is a homomorphism  $\mathbf{Z}_p^n \rightarrow G$ . Since  $G$  is finite it must factor through some  $\mathbf{Z}/(p^i)^n$ , so we get a map

$$\gamma^* : E_n^* BG \rightarrow \varinjlim_i E_n^* B\mathbf{Z}/(p^i)^n$$

that is invariant under conjugation.

Next note that since  $A = W(\mathbf{F}_{p^n})$  is a free  $\mathbf{Z}_p$ -module of rank  $n$ , we have an isomorphism  $\alpha : A \rightarrow \mathbf{Z}_p^n$ .

## The generalized character theorem (continued)

$$\begin{array}{ccccc}
 x & E_n^* \mathbf{BZ}/(p^i) & \xrightarrow{\varphi_i} & A[[x]]/(f^{(i)}(x)) & \longrightarrow & L_i \\
 \downarrow & \downarrow & & \downarrow f & & \downarrow \\
 [p](x) & E_n^* \mathbf{BZ}/(p^{i+1}) & \xrightarrow{\varphi_{i+1}} & A[[x]]/(f^{(i+1)}(x)) & \longrightarrow & L_{i+1}
 \end{array}$$

Passing to the colimit as  $i \rightarrow \infty$ , we get a ring homomorphism

$$\varphi : \varinjlim_i E_n^* \mathbf{BZ}/(p^i) \rightarrow L.$$

An element  $\gamma \in G_{n,p}$  is a homomorphism  $\mathbf{Z}_p^n \rightarrow G$ . Since  $G$  is finite it must factor through some  $\mathbf{Z}/(p^i)^n$ , so we get a map

$$\gamma^* : E_n^* \mathbf{B}G \rightarrow \varinjlim_i E_n^* \mathbf{BZ}/(p^i)^n$$

that is invariant under conjugation.

Next note that since  $A = W(\mathbf{F}_{p^n})$  is a free  $\mathbf{Z}_p$ -module of rank  $n$ , we have an isomorphism  $\alpha : A \rightarrow \mathbf{Z}_p^n$ . We also have a ring homomorphism  $\mu : \mathbf{Z}/(p^i) \rightarrow A/(p^i)$ .

## The generalized character theorem (continued)

Putting all this together gives, for each  $\gamma \in G_{n,p}$ , a diagram

$$\begin{array}{ccc} E_n^* BG & \xrightarrow{\gamma^*} & \lim_{\rightarrow i} E_n^* BZ / (p^i)^n \\ & & \parallel \alpha^* \\ & & \lim_{\rightarrow i} E_n^* BA / (p^i) \\ & & \downarrow \mu^* \\ & & \lim_{\rightarrow i} E_n^* BZ / (p^i) \xrightarrow{\varphi} L \end{array}$$

The Lubin-Tate construction  
Morava  $E$ -theory

The generalized character theorem

## The generalized character theorem (continued)

Putting all this together gives, for each  $\gamma \in G_{n,p}$ , a diagram

$$\begin{array}{ccc} E_n^* BG & \xrightarrow{\gamma^*} & \lim_{\rightarrow i} E_n^* BZ / (p^i)^n \\ & & \parallel \alpha^* \\ & & \lim_{\rightarrow i} E_n^* BA / (p^i) \\ & & \downarrow \mu^* \\ & & \lim_{\rightarrow i} E_n^* BZ / (p^i) \xrightarrow{\varphi} L \end{array}$$

Thus, we have a map  $G_{n,p}/G \rightarrow \text{Hom}(E_n^* BG, L)$ ,

HKR again

Doug Ravenel

Precedents

- Atiyah's theorem
- A finiteness theorem
- Classical character theory

Morava  $K$ -theory Euler characteristics

- Commuting  $n$ -tuples
- Counting orbits

Generalized characters

- The Lubin-Tate construction
- Morava  $E$ -theory

The generalized character theorem

## The generalized character theorem (continued)

Putting all this together gives, for each  $\gamma \in G_{n,p}$ , a diagram

$$\begin{array}{ccc} E_n^* BG & \xrightarrow{\gamma^*} & \lim_{\rightarrow i} E_n^* BZ / (p^i)^n \\ & & \parallel \alpha^* \\ & & \lim_{\rightarrow i} E_n^* BA / (p^i) \\ & & \downarrow \mu^* \\ & & \lim_{\rightarrow i} E_n^* BZ / (p^i) \xrightarrow{\varphi} L \end{array}$$

Thus, we have a map  $G_{n,p}/G \rightarrow \text{Hom}(E_n^* BG, L)$ , which is dual to a map  $E_n^* BG \rightarrow Cl_{n,p}(G; L)$ .

## The generalized character theorem (continued)

Putting all this together gives, for each  $\gamma \in G_{n,p}$ , a diagram

$$\begin{array}{ccc} E_n^* BG & \xrightarrow{\gamma^*} & \lim_{\substack{\rightarrow \\ i}} E_n^* BZ / (p^i)^n \\ & & \parallel \alpha^* \\ & & \lim_{\substack{\rightarrow \\ i}} E_n^* BA / (p^i) \\ & & \downarrow \mu^* \\ & & \lim_{\substack{\rightarrow \\ i}} E_n^* BZ / (p^i) \xrightarrow{\varphi} L \end{array}$$

Thus, we have a map  $G_{n,p}/G \rightarrow \text{Hom}(E_n^* BG, L)$ , which is dual to a map  $E_n^* BG \rightarrow Cl_{n,p}(G; L)$ .

This leads to the character map  $\chi_G$  in the theorem.
