## Math 531 Problem Set \#3 Due 9/22/04

1. The definition of a Noetherian $R$-module for a ring $R$ is very similar to that of a Noetherian ring. We say that $M$ is a Noetherian $R$-module if it satisfies the ascending module property, which says that given any ascending chain $R$-submodules of $R$ as below

$$
M_{0} \subseteq M_{1} \subseteq \cdots \subseteq M_{j} \subseteq \ldots
$$

there is some $N$ such that $M_{n}=M_{n+1}$ for all $n \geq N$. As with rings, this is equivalent to saying that all of the $R$-submodules of $M$ are finitely generated.

Let $M$ be a Noetherian $R$-module and let

$$
0 \longrightarrow M^{\prime} \longrightarrow M \longrightarrow M^{\prime \prime} \longrightarrow 0
$$

be an exact sequence of $R$-modules. Show that
(a) $M^{\prime}$ is a Noetherian $R$-module; and
(b) $M^{\prime \prime}$ is a Noetherian $R$-module.
2. Let $R$ be a Noetherian integral domain, let $I$ be an ideal of $R$,and let $S \subset R$ be a nonempty multiplicative set with $0 \notin S$. Let $\varphi$ be the usual map from $R$ to $S^{-1} R$. Show that if $S \cap I$ is empty, then $R_{S} \phi(I)$ is not all of $R_{S}$.
3. Let $R$ be a ring and let $\phi: R \longrightarrow R / I$ be the natural quotient map.
(a) Show that the map

$$
\phi^{-1}: J \longrightarrow \phi^{-1}(J)
$$

from ideals in $R / I$ to ideals in $R$ gives a bijection between the set of ideals in $R / I$ and the set set of ideals in $R$ that contain $I$.
(b) Show that the map $\phi^{-1}$ from prime ideals in $R / I$ to prime ideals in $R$ gives a bijection between the set of prime ideals in $R / I$ and the set set of prime ideals in $R$ that contain $I$.
4. Find a ring $R$ and an ideal $I$ for which there is an element $c \in I^{2}$ that cannot be written as $a b$ where $a, b \in I$.

5 . (p. 6, Ex.3) Show that if $\left\{R_{i}\right\}$ is a family of integrally closed subrings of a field $K$, then the intersection

$$
\bigcap_{i} R_{i}
$$

is also integrally closed.
6. (p.14, Ex. 2) Let $R$ be a Noetherian integral domain with field of fractions $K$ and let $M$ be an $R$-submodule of a finite dimensional
$R$-vector space. Prove that

$$
M=\bigcap_{\mathcal{P} \text { maximal }} R_{\mathcal{P}} M
$$

7. Let $K$ be a field and let $F$ be a polynomial of positive degree with coefficients in $K$, which factors as

$$
F(X)=\prod_{i=1}^{n}\left(f_{i}(X)\right)^{e_{i}}
$$

where $e_{i}$ are positive integers, the $f_{i}$ have positive degree, and $K[X] f_{i}+$ $K[X] f_{j}=1$ for $i \neq j$.
(a) Show that

$$
K[X] /(F(X)) \cong \sum_{i=1}^{n} K[X] /\left(f_{i}(X)^{e_{i}}\right)
$$

(b) Show that $K[X] /(F(X))$ is Noetherian and has dimension 0 .
