## Math 531 Tom Tucker

How can we identify a DVR? The following will help.
A couple remarks first:
(1) If $I$ and $J$ are principal then so is $I J$. In particular, any power of a principal ideal is principal.
(2) Notation: for any ideal $I$ of $R$, we say $I^{0}=R$.

Proposition 5.1. Let $R$ be a Noetherian local domain of dimension 1 with maximal ideal $\mathcal{M}$ and with $R / \mathcal{M}=k$ its residue field. Then the following are equivalent
(1) $R$ is a $D V R$;
(2) $R$ is integrally closed;
(3) $\mathcal{M}$ is principal;
(4) there is some $\pi \in R$ such that every element $a \in R$ can be written uniquely as $u \pi^{n}$ for some unit $u$ and some integer $n \geq 0$.
(5) every nonzero ideal is a power of $\mathcal{M}$;

Proof. $(1 \Rightarrow 2)$ Suppose that $b \in K \backslash R$. Then $v(b)<0$, so for any monic polynomial in $b$ with coefficients in $R$, we have

$$
v\left(b^{n}+a_{n} b^{n-1}+\cdots+a_{0}\right)=v\left(b^{n}\right)<0
$$

which means that $b^{n}+a_{n} b^{n-1}+\cdots+a_{0} \neq 0$.
$(2 \Rightarrow 3)$ Let $a \in \mathcal{M}$. There is some $n$ for which $\mathcal{M}^{n} \subset(a)$ (by "Poor Man's Factorization" in Noetherian rings) but $\mathcal{M}^{n-1}$ is not contained in (a) (note $n-1$ could be zero). Let $b \in \mathcal{M}^{n-1} \backslash(a)$ and let $x=a / b$. We can show that $\mathcal{M}=R x$. This is equivalent to showing that $x^{-1} \mathcal{M}=R$. Note that since (b) is not in $(a), b / a=x^{-1}$ cannot be in $R$. Hence, it cannot be integral over $R$. By Cayley-Hamilton, $x^{-1} \mathcal{M} \neq \mathcal{M}$ since $\mathcal{M}$ is finitely generated as an $R$-module and $x^{-1} \notin R$ and $R$ is integrally closed. Since $x^{-1} \mathcal{M}$ is an $R$-module and $x^{-1} \mathcal{M} \subset R$ (this follows from the fact that $b \mathcal{M} \subset \mathcal{M}^{n} \subset(a)$ ), this means that $x^{-1} \mathcal{M}$ is an ideal of $R$ not contained in $\mathcal{M}$. So $x^{-1} \mathcal{M}=R$, as desired.
$(3 \Rightarrow 4)$ Let $\pi$ generate $\mathcal{M}$. Now, let $a \in R$. We define $w(a)$ to be the smallest $n$ for which $\mathcal{M}^{n} \subset R a$; such an $n$ exists by "Poor Man's Factorization" in Noetherian rings. We will show by induction that that $a$ can be written as $u \pi^{w(a)}$ for some unit $u$. The case $w(a)=0$ is trivial, since $w(a)=0$ means $a$ is a unit. If $w(a) \geq 1$, then $a \in \mathcal{M}$. Then we can write $a=\pi b$ for some $b$. Since, any element in $\mathcal{M}^{n}$, which is simply the set of $z \pi^{n}$ for $z \in R$, can be written as $x a$ for some $x \in R$, any element $z \pi^{w(a)-1}$ in $\mathcal{M}^{w(a)-1}$ can be written as $x b$ for that same $x$. Hence $w(b) \leq w(a)-1$. By the same reasoning, $w(b) \geq w(a)-1$. Hence $w(b)=w(a)-1$. So we can write $b$ uniquely as $u \pi^{w(b)}$ for some unit $u$, which gives $a=u \pi^{w(a)}$ uniquely.
$(4 \Rightarrow 5)$ Let $I$ be an ideal of $R$. Since $I$ is finitely generated, it has generators $m_{1}, \ldots, m_{n}$ which can all be written as $u_{i} \pi^{t_{i}}$. Then the $i$ for which $t_{i}$ is smallest will generate $I$ from above.
$(5 \Rightarrow 1)$ Let $a \in R$. Then $R a=\mathcal{M}^{n}$ for some unique $n$. Letting $v(a)=n$ gives the desired valuation.

Example 5.2. The ideal $\mathcal{P}$ generated by 2 and $\sqrt{5}-5$ in $\mathbb{Z}[\sqrt{5}]$ is prime but $\mathbb{Z}[\sqrt{5}]_{\mathcal{P}}$ is not a DVR. More on this later.

Recall, a Dedekind domain is a Noetherian domain $R$ such that $R_{\mathcal{P}}$ is a DVR for every nonzero prime $\mathcal{P}$ of $R$. The ideal structure is a bit more complicated than that of a DVR. Recall that in any noetherian ring $R$ for every ideal $I$ we can write $\prod_{i=1}^{n} \mathcal{P}_{i} \subset I$ with $\mathcal{P}_{i} \supset I$. We'll prove that in a Dedekind domain we can write get an inequality and get it uniquely.

One more thing: we'll want to work in Noetherian domains of (Krull) dimension 1 more generally, as you'll see later. So we'll try to state results for them when possible.

To understand how to factorize an ideal $I$, we'll want to understand $R / I$. To help us with this we'll want the Chinese remainer theorem.

The Chinese remainder theorem really consists of writing 1 in a lot of different ways. Let's prove the following easy Lemma.
Lemma 5.3. Let $I$ and $J$ be ideals in $R$. Suppose that $I+J=1$. Then
(1) $I \cap J=I J$; and
(2) for any positive integers $m, n$, we have $I^{m}+J^{n}=1$.

Proof. Since $I+J=1$, we can write $a+b=1$ for $a \in I$ and $b \in J$. Now 1. follows from the fact that for if $x \in I \cap J$, then $x=(a+b) x=$ $a x+b x \in I J$, so $I \cap J \subset I J$. The reverse inclusion $I J \cup I \cap J$ is obvious. To prove 2., we simply write $(a+b)^{2(m+n)}=1$, and note that the expansion of $(a+b)^{2(m+n)}$ consists entirely of elements in either $I^{m+n} \subset I^{m}$ or $J^{m+n} \subset J^{n}$.
Lemma 5.4. Let $I$ and $J$ be ideals of $R$ and suppose that $I+J=1$. Then the natural map

$$
\phi: R \longrightarrow R / I \oplus R / J
$$

is surjective with kernel IJ.
Proof. The kernel is $I \cap J$ which equals $I J$ from the Lemma above. Now, to see that it is surjective, write $a+b=1$ with $a \in I$ and $b \in J$.

Then $b=1-a$ and $\phi(b)=(1,0)$ and $\phi(a)=(0,1)$. Since $\phi(R)$ is clearly a $R / I \oplus R / J$ module and $R / I \oplus R / J$ is generated by $(1,0)$ and $(0,1)$ as an $R / I \oplus R / J$ module, $\phi$ must be surjective.

Lemma 5.5. If $I+J_{1}=1$ and $I+J_{2}=1$, then $I+J_{1} J_{2}=1$.
Proof. Writing $a+b=1$ for $a \in I$ and $b \in J_{1}$ and writing $a^{\prime}+b^{\prime}=1$ for $a \in I$ and $b \in J_{2}$, we see that

$$
1=(a+b)\left(a^{\prime}+b^{\prime}\right)=a a^{\prime}+a b^{\prime}+b a^{\prime}+b b^{\prime} \subset I+J_{1} J_{2} .
$$

Proposition 5.6. (Chinese Remainder theorem) Let $R$ be a ring and let $I_{1}, \ldots, I_{n}$ be a set of ideals of $R$ such that $I_{j}+I_{k}=1$ for $j /-j$. Then the natural map

$$
R \longrightarrow \bigoplus_{j=1}^{n} R / I_{j}
$$

is surjective with kernel $I_{1} \cdots I_{n}$.
Proof. We proceed by induction on $n$. If $n=1$, then the result is obvious. Otherwise, write $I:=I_{1}$ and $J:=I_{2} \cdots I_{n}$. Applying the lemmas above, $I+J=1$ and the natural map

$$
R \longrightarrow R / I \oplus R / J
$$

is surjective with kernel $I J$. Since the natural map

$$
R \longrightarrow \bigoplus_{j=2}^{n} R / I_{j}
$$

is surjective with kernel $I_{2} \cdots I_{n}$ by the inductive hypothesis, we are done.
